InsideOUT House: A Binaural Installation

InsideOut House is a binaural audio installation in the form of a wooden outhouse, embedded with recorded woodland sounds. Using simulated blindness to enhance the aural sense, the project explores the human need for “involuntary” or effortless attention and aims to mimic the restorative experience of being outside in nature using auditory stimuli. While in the darkened structure, viewers are invited to visualize their experience by creating a drawing, which they may then contribute to the installation.

InsideOut House is currently on view at the BRIC Biennial in Brooklyn from September 20-December 14, 2014.
